Description

The Keysight 11713D/E attenuator/switch drivers provide remote or front panel drive control for programmable attenuators and electromechanical or solid-state switches. Designed with both benchtop and ATE environments in mind, these attenuator/ switch drivers provide an intuitive user interface, a variety of switching options, software programmability and remote-control features for quick, easy design validation and automated testing. Front panel pushbuttons and an easy-to-read LCD display simplify setup of functions such as voltage, TTL functions, continuous or pulse-drive, IP address, etc. The 11713D/E is an LXI Class C compliant instrument, so it can be easily controlled and triggered remotely using a full-featured graphical web interface. This feature is used in high-volume production environments. Software instrument drivers such as IVI-COM provide programming compatibility with popular application development environments and support PC industry standards such as Component Object Model (COM). Standard GPIB connectivity supports automated programmed scripting and ensures backward compatibility to Keysight 11713B/C attenuator/switch drivers.

These portable instruments come in a half-rack, 2U design with self-contained current limiting power supplies. The 11713E model also includes integrated tri-voltage supplies of 5, 15 & 24V and a user-defined external input voltage capability to ensure 100% biasing compatibility to most relays in the market. The 11713E has two individual banks of outputs each with an independent voltage drive.

1. The number of switches and attenuators that can be driven will depend on the type of switch configurations and the attenuator sections. The 11713E capable of driving twice as many devices as the 11713D; however, the total load current that can be consumed is still 3.4A
