Aggregate and measure large currents in multi-cable circuits

The Sensor Unit CT9555 Series are power supplies for high-precision current sensors with waveform output functionality.

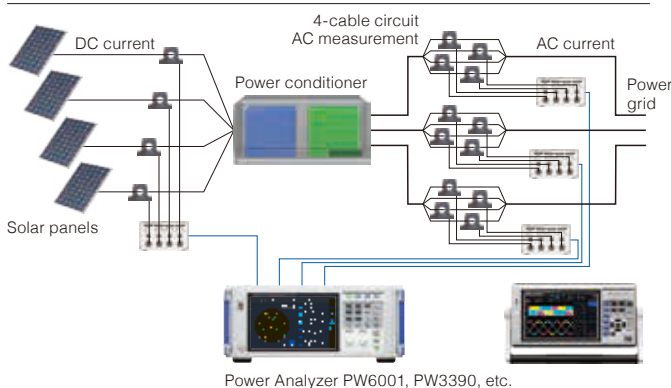

In addition to serving as a four-channel power supply, the CT9557 can also output a single waveform from an aggregate of input waveforms.

The CT9557's total output function adds current waveforms from up to four input channels, converting them into a 2 V f.s. waveform for output. The device, which can generate either total waveform output or total RMS output, makes it possible to measure equipment such as high-capacity solar power conditioners and inverters, even in installations where issues with ratings and cable diameters made measurement impossible in the past.

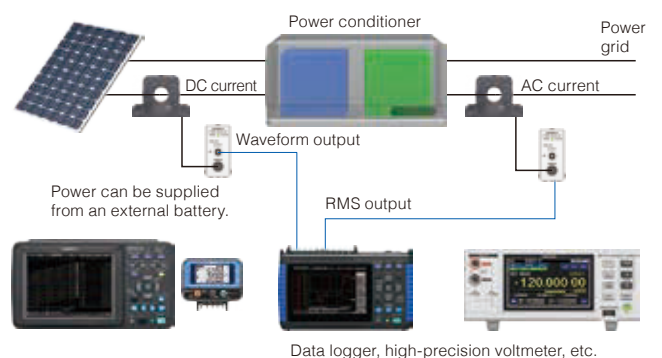

Measuring large currents and multi-cable circuits with sum functionality

Once a current sensor has been attached to each branch cable, the CT9557 adds the sensor signals together to create a total signal. Since the device can treat multiple sensors as a single sensor, as illustrated in the figure above, the current can be measured using a single power meter.

Using a data logger to perform high-precision current measurement

In this setup, waveform output is monitored on the DC current side, and RMS output is monitored on the AC current side of the circuit. Even a logger that lacks RMS conversion functionality can be used to measure AC current. A wireless logger can also be used. If a high-precision voltmeter is used, both the AC and DC currents can be measured with a high degree of precision.
