Channel configurations

Table 2. Channel configuration specifications

Channel	Category	Conditions	Specification
T0x-T3x	Disabled	All temperature input channels are disconnected from screw terminals and internally connected to GND.	See Note 4
T0x-T3x	Thermocouple Note 1		4 differential channels

V0x-V3x	Differential Note 2		4 differential channels
V0x-V3x	Single-ended		4 single-ended channels

- Note 1:** Internally, the REDLAB TC-AI has four, dual-channel, fully differential A/Ds providing a total of eight input channels.
- Note 2:** When connecting differential inputs to floating input sources, you must provide a DC return path from each differential input to ground. To do this, connect a resistor from each of the differential inputs to GND. A value of approximately 1Meg ohm can be used for most applications.
- Note 3:** Channel configuration information is stored in the EEPROM of the isolated microcontroller by the firmware whenever any item is modified. Modification is performed by commands issued over USB from an external application, and the configuration is made non-volatile through the use of the EEPROM.
- Note 4:** The factory default configuration is **Disabled**. The Disabled mode will disconnect the temperature and voltage inputs from the terminal blocks and internally connect ground (GND) to all of the A/D inputs.

Note 5: Thermocouple measurement accuracy specifications include polynomial linearization, cold-junction compensation and system noise. These specs are for one year, or 3000 operating hours, whichever comes first, and for operation of the REDLAB TC-AI between 15 °C and 35 °C. There is a CJC sensor on the temperature sensor input side of the module. The accuracy listed above assumes the screw terminals are at the same temperature as the CJC sensor. Errors shown do not include inherent thermocouple error. Contact your thermocouple supplier for details on the actual thermocouple accuracy error.

- Note 6:** Thermocouples must be connected to the REDLAB TC-AI such that they are floating with respect to GND (pins 9, 19, 22, 27, 30, 33, 36, 39, 49). The REDLAB TC-AI GND pins are isolated from earth ground. You can connect thermocouple sensors to voltages referenced to earth ground as long as the isolation between the GND pins and earth ground is maintained.
- Note 7:** When thermocouples are attached to conductive surfaces, the voltage differential between multiple thermocouples must remain within ± 1.4 V. For best results, we recommend using insulated or ungrounded thermocouples when possible.

Absolute Accuracy: V0x-V3x

Table 5. Calibrated absolute accuracy specifications

Range	Absolute Accuracy (mV)
± 10 V	± 2.779
± 5 V	± 1.398
± 2.5 V	± 0.707
± 1.25 V	± 0.362

- Note 8:** When connecting differential inputs to floating input sources, the user must provide a ground return path from each differential input to ground. To do this, simply connect a resistor from each of the differential inputs to GND. A value of approximately 1Meg ohm can be used for most applications.
- Note 9:** All ground pins on the REDLAB TC-AI (pins 9, 19, 22, 27, 30, 33, 36, 39, 49) are common and are isolated from earth ground. If a connection is made to earth ground when using both voltage inputs and conductive thermocouples, the thermocouples are no longer isolated. In this case, thermocouples must not be connected to any conductive surfaces that may be referenced to earth ground
- Note 10:** Unused voltage inputs should not be left floating. These inputs should be placed in the Disabled mode or connected to GND.
