## 1 General Description

SSM5000A series switch matrix, can expand the number of test ports of network analyzer, signal source, spectrum analyzer and other equipment. The series names are like SSM5XYZA, The $X$ represents different operating frequency, $Y$ represents the number of combiner ports, $Z$ represents the number (divided by 6) of division ports. When $X$ is 1 , the operating frequency range covers 9 $\mathrm{kHz}-9 \mathrm{GHz}$, when it is 3 , covers $100 \mathrm{kHz}-26.5 \mathrm{GHz}$. And the series are with up to 4 input ports and up to 24 output ports, supporting USB, LAN, Direct Control communication modes. The Direct Control interface on the switch matrix can further expand the number of test ports and support a simplified multi-port calibration algorithm, which can greatly improve the efficiency of calibration. In addition to SIGLENT instruments, it also supports other brand instruments. It is suitable for 19-inch standard chassis and can be widely used in multi-port test environments such as antennas and 5G component modules.

## 2 Features

M. Characteristic impedance: $50 \Omega$

Wighest frequency: 9 GHz (or 26.5 GHz )
W- Maximum number of input ports: 4
4. Maximum number of output ports: 24

4- RF connector: 3.5 mm female
IT Maximum input power: 20 dBm
If Maximum input DC voltage: 35 V
It Interface: LAN, USB Device, Direct Control (in), Direct Control (out)
4 Screen size: 2.4-inch

## 3 Block Diagrams

Different model can be obtained by different sub-module combination. For example, the SSM5144A switch matrix consists of 8 switch sub-modules, including four 1-4 switches and four 2-6 switches.

## 4 Application Scenarios

## Application scenario 1:

The switch matrix is used to expand the test ports of network analyzer and measure $S$ parameters of multiple devices, according to the specific test requirements, the matrix switch can be extended into 24 single ports, 12 full 2 ports, 8 full 3 ports, 6 full 4 ports, 4 full 6 ports, 3 full 8 ports, 2 full 12 ports, 1 full 24 ports, etc. The figure below shows scaling to 4 full 6 ports. In this case, you only need to perform full 6-Port calibration on four group of ports 1-6, 7-12, 13-18 and 19-24. DUT1, DUT2, DUT3 and DUT4 devices can be tested by software, greatly improving the test efficiency.

Application scenario 2:
Using a switch matrix with a signal source and spectrum analyzer, the signal source and spectrum analyzer are extended to 24 ports, which can be used to test the transmission and receiving parameters of multiple DUTs. In this case, S parameter calibration is not required, only the line loss of each channel needs to be calibrated. When testing the transmission performance, the software switches to 24 ports in turn, then the expansion of the signal source is completed; when testing the receiving performance, the software can also switch to 24 ports in turn to complete the expansion of the spectrum analyzer. The matrix switch can greatly reduce the number of signal source and spectrum analyzer, therefore save cost and improve test efficiency.

## 5 Definitions

Specifications: All products are guaranteed to meet published specifications at room temperature (approximately $25^{\circ} \mathrm{C}$ ), unless otherwise noted.

Typical: Performance deemed typical implies that 80 percent of the measurement results will meet the typical published performance with a 95th percentile confidence level at room temperature (approximately $25^{\circ} \mathrm{C}$ ). Typical performance is not warranted and does not include measurement uncertainty.

Nominal: This value indicates the expected mean or average performance, or an attribute whose performance is by design, such as the 50 Ohm connector. The typical published performance with a 95th percentile confidence level at room temperature (approximately $25^{\circ} \mathrm{C}$ ). Typical performance is not warranted and does not include measurement uncertainty.
